

Objective

Monitor 10 systems on a network and view their status.

LLNMS Scope

This involves managing network assets. The primary objective is to create the assets, create the desired scanning tools, then scan assets periodically.

Tasks Required

Create Assets

To create assets, use `llnms-create-asset`. This will create the asset for LLNMS to use.

Register Assets

Asset registration will add each available scanner to the asset and allow the user to configure them as necessary. To register an asset, use `llnms-register-asset`.

Scan Assets

Asset scanning will run each scanner for the asset and report the results. To run a scan on all assets, use `llnms-scan-assets`. To run a scan on an individual asset, run `llnms-scan-asset`.
